

# CAR PARK SHADE

PARKING LOT STRUCTURES

## OPEN & SPACIOUS

Available in a range of forms, car park shades are the perfect way to protect your vehicles from the damaging effects of the sun - no more blistered paintwork or faded interiors! These bespoke structures not only provide excellent sun protection and heat reduction; we guarantee that they will do so for a long time, which is why they're backed by our unique 15 year warranty. With clean, simple forms that are compatible with a variety of architectural approaches, car park shades are an excellent way to cover large areas with ease while still ensuring an open and spacious feel underneath.

## WARRANTY

These structures are covered by our unique 15 year warranty.

## ENGINEERED

All car park shade framework is structurally engineered. This is required for council permits and gives you the added assurance that your structure will be safe for years to come.

## FABRIC

The shade cover is manufactured from heavy duty materials – either shade mesh or PVC fabric, which provide UVR protection of up to 99% without losing natural light under the canopy. The design is modular, but each shade structure is individually created, custom made and fitted to suit each site.

## FRAMEWORK

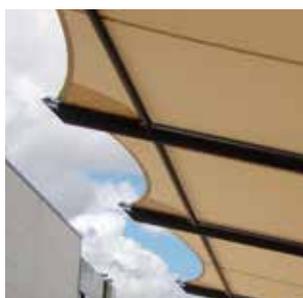

Our ultra-strong steel poles are galvanised inside and out for ultimate protection against rust and weather damage. An extra option of a paint finish is also available to ensuring your structure will fit in with any existing colour schemes with the added protective benefits that the extra finish offers.

## HARDWARE

All hardware is marine grade stainless steel to ensure rusting is not an issue and all structural bolts are galvanised. The tensioning system is fully adjustable to enable tensioning to be carried out later in the shade's life, should it become necessary.

## EXTRAS

A range of lighting options, fabrics, colours and design styles are available to ensure the finished product is exactly what you need.

## GALVANISED – STANDARD

1. Black steel. All steel fabrication is completed before any protective coatings are applied.
2. Steel is then chemically cleaned to ensure all impurities are removed.
3. Steel framework is then immersed in a 450°C bath of molten zinc. The zinc is metallurgically fused into the steel itself, becoming part of the steel's surface by forming tough zinc-iron alloy layers that are actually harder than the base metal, as well as outer protective layers of pure solidified zinc. This immersion process ensures a uniform coating that covers the entire surface area including all internal surfaces.

## PAINT FINISH – OPTIONAL

4. Galvanised steelwork is sweep blasted to provide an extra smooth clean surface.
5. Specialty etch primer is applied to all exterior surfaces.
6. 2-pack polyurethane paint finish applied to all exterior surfaces. This is an ultra hard enamel paint that will withstand exposure to the outdoor elements.
