

SOLA GOLA

PRACTICAL, FUNCTIONAL AND STYLISH

No product ticks all the boxes quite like a SolaGola canopy. Traditional, practical, functional and stylish as well as cost effective, this product has proved to be the canopy of choice for hundreds of commercial and school applications. The SolaGola roofing material is 99.9% UV protective and you can also control the atmosphere, light and heat transmission through the different tint options we have available.

With steelwork hot-dipped galvanised and available in any colour and structures of any size for your convenience, SolaGola's are designed and manufactured entirely in New Zealand to cater to your specific requirements. This canopy is strong enough to support foot traffic and with its weather protective surface coating, the SolaGola will last for years!

WARRANTY FOR LONG LIFE

WARRANTY

Each covered walkway structure is covered with our 15 year warranty and a lifetime guarantee on workmanship.

ENGINEERED

We provide structural engineering for any covered walkway structure. This is required for council permits and gives you the added assurance that your structures will be safe for years to come.

CANOPY

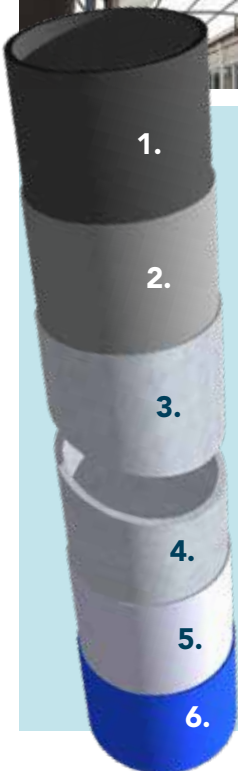

The hardtop canopy is available in a polycarbonate or fibreglass material with varying tints to choose from – ranging from clear to completely opaque. This enables you to control the atmosphere, light and heat transmitted, ensuring your outdoor space is exactly what you want.

FRAMEWORK

Our ultra-strong steel RHS sections are galvanised inside and out for ultimate protection against rust and weather damage. An extra option of a paint finish is also available to ensuring your structure will fit in with any existing colour schemes with the added protective benefits that the extra finish offers.

EXTRAS

There is a range of lighting options to choose from. Other roofing options such as toughened glass or profile metal roofing are also able to be integrated into your design.

GALVANISED – STANDARD

1. Black steel. All steel fabrication is completed before any protective coatings are applied.
2. Steel is then chemically cleaned to ensure all impurities are removed.
3. Steel framework is then immersed in a 450°C bath of molten zinc. The zinc is metallurgically fused into the steel itself, becoming part of the steel's surface by forming tough zinc-iron alloy layers that are actually harder than the base metal, as well as outer protective layers of pure solidified zinc. This immersion process ensures a uniform coating that covers the entire surface area including all internal surfaces.

PAINT FINISH – OPTIONAL

4. Galvanised steelwork is sweep blasted to provide an extra smooth clean surface.
5. Specialty etch primer is applied to all exterior surfaces.
6. 2-pack polyurethane paint finish applied to all exterior surfaces. This is an ultra hard enamel paint that will withstand exposure to the outdoor elements.
